COURSES OFSTUDIES

PHYSICS SYLLABUS FOR M.Sc DEGREE UNDER SEMESTER SYSTEM

SCHOOL OF PHYSICS
GANGADHAR MEHER UNIVERSITY

AMRUTA VIHAR, SAMBALPUR-768004, ODISHA

29[th]Sep 2021

VISION

To take the leadership in setting the standard of Physics Education in terms of Teaching and Research in the State and in the Country that will have a transformative impact on society through continual innovation in education, research and creativity.

MISSION

M1 - To make quality education accessible to students.

M2- To maintain high academic standards in teaching and research consistent with global scenario.

M2 - To encourage and facilitate faculty, researchers and students to work synergistically.

M3 - To establish collaboration with other academic and research institutes.

PROGRAMME OUTCOMES
(Chosen from the allowed list as set by UGC)

PO-1: Disciplinary Knowledge: Demonstrate comprehensive knowledge and skills of the disciplines that constitute a programme of study.

PO-2: Critical Thinking: Capability to apply analytic thought to a body of knowledge; analyse and evaluate evidence, arguments, claims, beliefs on the basis of empirical evidence; identify relevant assumptions or implications; formulate coherent arguments; critically evaluate practices, policies and theories by following scientific approach to knowledge development.

PO-3: Problem solving: Capacity to extrapolate from what one has learned and apply their competencies to solve different kinds of non-familiar problems, rather than replicate curriculum content knowledge; and apply one's learning to real life situations.

PO-4: Research related skills: Demonstrate a sense of inquiry and capability for asking relevant questions; ability to recognize cause-and effect relationships, define problems, formulate and test hypotheses, analyze, interpret and draw conclusions from data; plan, execute and report the results of an investigation.

PO-5: Scientific reasoning: Ability to analyse, interpret and draw conclusions from quantitative/qualitative data; and critically evaluate ideas, evidence and experiences from an open-minded and reasoned perspective.

PO-6: Digital Literacy: Capacity to use ICT in a variety of learning situations; demonstrate ability to access, evaluate and use variety of relevant information sources; use appropriate software for data analysis

PROGRAMME OBJECTIVES
(Set by School of Physics)

- Apply theoretical and Experimental knowledge in Physics to solve various problems in physical sciences.
- Develop abilities and skills that encourage research and development activities and are useful in everyday life

- Impart quality education in physics to students through well designed courses of fundamental interest and of technological importance.
- Develop the skill to plan, execute and report the result of extended experimental and theoretical Physics.

PROGRAMME SPECIFIC OUTCOMES
(Set by School of Physics)

PSO-1: Demonstrate the in-depth knowledge in various branches of Physics.

PSO-2: Apply theoretical Knowledge of Physics into various practical problems.

PSO-3: Interpret various Mathematical techniques and Mathematical models of physical behavior

PSO-4: Improve the fundamental concepts and advance techniques of Physics and Scientific methodology.

PSO-5: Enhance Intellectual, Computational, Experimental and Analytical skills of Physical Science.

PSO-6: Familiar with contemporary research within various fields of physics and have the background and experience required to model, analyze, and solve advanced problems in physics.

A Brief Overview of Syllabus

Course No.	Name of Course	Marks	Credit
FIRST SEMESTER			
PHY-101	Mathematical Methods in Physics	20+10+70	4
PHY-102	Classical Mechanics	20+10+70	4
PHY-103	Quantum Mechanics-I	20+10+70	4
PHY-104	Electronics	20+10+70	4
PHY-105	Electronics Lab	100	6
SECOND SEMESTER			
PHY-201	Classical Electrodynamics	20+10+70	4
PHY-202	Quantum Mechanics-II	20+10+70	4
PHY-203	Solid State Physics	20+10+70	4
PHY-204	Applied Optics	20+10+70	4
PHY-205	Computational Physics Lab	100	6
PHY-206	Open Elective (DSE) (Atomic and Molecular Spectroscopy)	20+10+70	4
THIRD SEMESTER			
PHY-301	Nuclear Physics	20+10+70	4
PHY-302	Particle Physics	20+10+70	4
PHY-303	Special Paper-I (Advanced Condensed Matter Physics)	20+10+70	4
PHY-304	Statistical Mechanics	20+10+70	4
PHY-305	Lab:Optics and Modern Physics Lab	100	6
PHY-306	Open Elective (IDSE)(Nano Science and Nano Technology)	20+10+70	4
FOURTH SEMESTER			
PHY-401	Energy Harvesting and Storage Materials	20+10+70	4
PHY-402	Advanced Quantum Mechanics	20+10+70	4
PHY-403	Special Paper-II (Advanced Condensed Matter Physics)	20+10+70	4
PHY-404	Experimental Techniques in Physics	20+10+70	4
PHY-405	Project/Dissertation	100	6
		Total Marks=2200	Total Credit=96

RELEVANCE TO THE LOCAL, NATIONAL, REGIONAL AND GLOBAL DEVELOPMENTAL NEEDS

The contents incorporated in all the courses of the syllabus are relevant to **global developmental needs**.

Employability -   ▮   Entrepreneurship -   ▮   Skill Development -   ▮

PHY-101: Mathematical Methods in Physics

Course Objective: *To apply general idea of Mathematical Methods for understanding the critical aspects of Physical Sciences.*

Prerequisites: *Knowledge of elementary complex number, elementary differential equations and their solutions, different types of Mathematical functions.*

UnitI   **12hrs**

Curvilinear coordinate system: Gradient, Divergence, Curl, Laplacian in cylindrical and spherical coordinate system.

Complex Integrations: Calculus of Residues, Cauchy's residue theorem, Evaluation of definite integrals. Evaluation of Contour integration involving branch points andcuts.

UnitII   **08hrs**

Tensor Analysis: Cartesian tensors, Rank of tensor, Operation of Tensors, Covariant and contravariant vector, covariant derivatives, Christoffel symbol and metric tensor, Riemann &Ricci tensor, Levi-Civita Tensor, Tensor form of gradient, divergence and curl.

UnitIII   **08hrs**

Groups and Group Representations: Definition of groups, abelian and cyclic groups, Sub groups and classes, Finite groups, Group representations, Characters, Infinite groups and Lie groups, Irreducible representations of SU(2), SU(3) and O(3), SO(3,1).

UnitIV   **12hrs**

Special Functions: Legendre Polynomial, Associated Legendre Polynomial, Bessel's Function of first kind and second kind, Hankel's function, Modified Bessel's function, Hypergeometric and Confluent Hypergeometric functions,Solution of inhomogeneous partial differential equation by Green's function, Fourier and Laplace transformation.

3. Mathematical Methods for Physics and Engineering -K. F. Riley, M. P. Hobson and S. J. Bence, (2006), Cambridge University Press, 3rd Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1:Understand the use of Residue theorem for evaluation of complex contour and definite integrals.
CO2: Use various tensors with their operation mechanism in theoretical Physics.
CO3: Apply group theory to solve some mathematical problems of interest in physics.
CO4: Apply the mathematical formulation of various special functions in theoretical Physics.

CO-PO Mapping (PHY 101)

CO2	3	2	3	2	2	2
CO3	3	3	3	3	2	2
CO4	2	3	3	2	3	3

PHY-102: Classical Mechanics

Course Objective: *To learn the Lagrangian and Hamiltonian formalisms for solving dynamics of different classical systems.*

Prerequisites: *Knowledge of Newtonian Mechanics, Knowledge of solving elementary differential equations.*

UnitI   10hrs
Mechanics of a System of Particles, Lagrangian Formulation, Velocity-Dependent Potentials andDissipation Function, Conservation Theorems and Symmetry Properties, Homogeneity and Isotropy of Space and Conservation of Linear and Angular Momentum, Homogeneity of Time and Conservation of Energy. Calculus of Variations and Euler-Lagrange's Equation, Brachistochrone Problem, Hamilton's Principle, Extension of Hamilton's Principle to NonholonomicSystems,

UnitII   10hrs
HamiltonianFormulation: LegendreTransformationandtheHamiltonEquationsofMotion,PhysicalSignificanc eofHamiltonian,DerivationofHamilton'sEquationsofMotionfromaVariationalPrinciple,Routh's Procedure, Δ-Variation, Principle of LeastAction.
Canonical Transformations: Canonical Transformation, Types of Generating Function, Conditions for Canonical Transformation, Integral Invariance of Poincare, Poisson Bracket, Poisson's Theorem, Lagrange Bracket,PoissonandLagrangeBracketsasCanonicalInvariant,InfinitesimalCanonicalTransformationand ConservationTheorems.

UnitIII   10hrs
Hamilton Jacobi Theory: Hamilton-Jacobi Equation for Hamilton's Principal Function, Harmonic Oscillator and Kepler problem by Hamilton-Jacobi Method, Action-Angle Variables for completely Separable System, Kepler Problem in Action-Angle Variables, Geometrical Optics and Wave Mechanism.
Small Oscillation: Problem of Small Oscillations, Example of Two coupled Oscillator, General Theory of SmallOscillations,NormalCoordinatesandNormalModesofVibration,FreeVibrationsofaLinearTriatomic Molecule.

UnitIV   10hrs
Rigid Body Motion: The Independent of Co-ordinates of a Rigid Body, Orthogonal Transformations. The Euler's angles. The Cayley-Klein parameters; Euler's Theorems on the Motion of a Rigid body, Infinitesimal Rotations, Rate of Change of a Vector, The Coriolis Force.
Rigid Body Dynamics: Angular Momentum and Kinetic Energy of Motion about a Point. The Inertia Tensor and Moment of Inertia, Eigenvalues of Inertial Tensor and the Principal Axis. Transformation. The Euler Equations of Motion, Torque-free motion of a rigid body. The Heavy Symmetrical Top with One Point Fixed.

4. A Treatise on the Analytical Dynamics of Particles and Rigid Bodies- E.T.Whittaker, (1999), Cambridge University Press, 4th edition.

COURSE OUTCOME

After completing this course, the students should be able to:

CO1: Classify the motion of rigid bodies based on frames of reference and the conservation laws by
 Lagrangian mechanics.
CO2: Formulate problems ofsystem of particles using Hamiltonian, canonical transformation and
        Poisson's bracket.
CO3: Interpret the equations of motion for mechanical systems for planar and spatial cases using Hamilton-Jacobi formalism.
CO4: Apply the theory of small oscillations in various vibratory systems.
CO5: Analyze the motion of rigid bodies based on frames of references.

CO5	3	3	2	3	2	2

PHY-103: Quantum Mechanics - I

Course Objective: *To learn the formalism of Quantum mechanics in harmonic oscillator and hydrogen atom.*

Prerequisites:*Knowledge of Historical development of Quantum Mechanics, Wave-particle duality, Schrodinger equation (time dependent and time independent).*

UnitI   **10hrs**

Linear Vector Space Formulation: Linear Vector Space (LVS) and its generality, Vectors-scalar product, basis vectors, linear independence, linear superposition of general quantum states, completeness, Closure Property, Schmidt's orthonormalisation procedure, Dual space, Bra and Ket vectors.

OperatorsandMatrixformalism: Eigen value and Eigen vectors of Linear, Adjoint, Hermitian, Unitary, Inverse, Antilinear, Projection, parity operators, Complete set of compatible operators, Noncommutativity and uncertainty relation, Matrix representation of vectors and operators, Eigen value equation and Expectation value, Transformation of basis vectors, Unitary transformation of vectors and operators, infinitesimal and finite unitary transformation, Continuous representation position and Momentum space wave function.

UnitII   **10hrs**

Quantum Dynamics: Time evolution of quantum states, Time evolution operator and its properties, Schrodinger/Heisenberg/ Interaction pictures, Equations of motion.

Operatormethodsolutionof1DHarmonicoscillator: Matrixrepresentationofcreationand annihilation operators, Densitymatrix.

RotationandOrbitalAngularMomentum: RotationMatrix,Angularmomentumoperatorsasthegenerators   of rotation, L_x, L_y, $L_z$and $L^2$and their commutator relations, Raising and lowering operators. ($L^+$and L^-). L_x, L_y, $L_z$and L^2in spherical polar coordinates, Eigen values and Eigen functions of L_z, L^2(OP method) spherical harmonics, Matrix representation of L^+, L^-andL^2.

UnitIII   **10hrs**

Spin Angular Momentum: Spin particles, pauli spin matrices and their properties Eigenvalues and Eigen functions, Spinor transformation under rotation.

Addition of angular momentum:

Total angular momentum **J**. Eigen value problem of $J_z$and J^2, Angular momentum matrices. Addition of angular momenta and C.G. co-efficients, Angular momentum states for composite systems in the angular momenta (1/2, 1/2) and (1, 1/2).

UnitIV   **10hrs**

MotioninSphericallySymmetricField: Hydrogenatom,Reductiontoequivalentonebodyproblem,Radial   equation, Energy eigen values and eigen functions, degeneracy, radial probability distribution. Free particle, problem incoming and outgoing spherical waves, expansion of plane waves in terms of spherical waves, Bound states of a 3-D square well, particle in asphere.

4. Introductory Quantum Mechanics- R. L. Liboff, (2009), Pearson Press, 3rd Edition.

COURSE OUTCOME

After completing this course, the students should be able to:

CO1: Identify orthogonal and normalized basis vectors by applying the concept of bra-ket vectors of Hilbert space.
CO2: Apply quantum mechanical operators with their corresponding eigen value and proper interpretation of unitary transformation associated with quantum mechanics.
CO3: Design time evolution of quantum state with its conservation properties.
CO3: Use operator formalism of Quantum Mechanics to solve one dimensional harmonic oscillator problem.
CO4: Predict the orbital, spin as well total angular momentum operator and C.G. coefficients for a composite angular system.
CO5: Determine the eigen value and eigen function for Hydrogen atom in a spherically symmetric potential and for a free particle.

PHY-104: Electronics

Course Objective: *To provide a comprehensive understanding of electronic devices and circuits.*

Prerequisites: *Basic knowledge on Semiconductors, diodes, transistors, Logic gates*

UnitI   **10hrs**

Network Theory: T and PI network, their inter conversations, Foster's reactance theorem, Thevenin's theoremandNorton'stheorem,Reciprocitytheorem,superpositionandcompensationtheorem,maximumpower transfertheorem.

Amplifiers: Frequency response of linear amplifiers through h-parameters, amplifier pass band, RC, LC. and transformer coupled amplifiers and their frequency response, gain band-width product, Millers theorem, Feedback amplifiers, effects of negative feedback, Boot-strapping the FET, Multistage feedback, Cascaded amplifier, stability in amplifiers, noise in amplifiers.

UnitII   **10hrs**

Operational amplifiers: The differential amplifiers, integral amplifier, rejection of common mode signals. The operational amplifier input and output impedances, application of operational amplifiers, unit gala buffer, summing, integrating and differentiating amplifiers, comparators and logarithmic amplifiers.

UnitIII   **12hrs**

Oscillator/ Multivibrator Circuits: Feedback criteria for oscillation, Hartley oscillator, Colpitt's oscillator, phase shift, Wien bridge oscillator, crystal controlled oscillator, klystron oscillator, Principle of multivibrator, Multivibrator circuits (Astable, Monostable, Bistable).

Digital Circuits: Logic fundamentals, Boolean theorem, Logic gates - RTL, DTL and TTL gates, CMS switches, RS flip-flop, JK flip-flops

UnitIV   **08hrs**

Radio Communication: Ionospheric propagation, Antennas of different types, super heterodyne, receiver (Block diagram).

Optical fibers: Guided modes of step-index and graded index fibers, Propagation light in optical fibers, Numerical aperture and Applications of optical fibers in Communication and Sensing.

3. Principle of Electronics, V.K.Mehta, R. Mehta, (1980), S. Chand, 3rd Editon.
4. Electronic Principles - Malvino and Bates, (2016), McGraw Hill. 8th Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1: Understand the working of basic cascaded amplifiers with their frequency response through network theory.
CO2: Apply various modes of OP-AMP for mathematical operations.
CO3: Design various types of oscillators and multivibrators in electronic applications.
CO4: Design the sequential logic circuits for various complex logic and switching devices with validation.

CO4	2	2	3	2	3	3

PHY-105: Electronics Lab
Laboratory (6 hrs per week)

Course Objective: *To identify and test various electronic components,design and implement feedback amplifier circuits and to measure the frequency of oscillators.*

1. Characteristics of Diode and Zenerdiode.
2. Study of differentgates
3. Making AND, OR, NOT Gates using NANDGates.
4. verification of BooleanAlgebra.
5. Verification of Dualnature.
6. Characteristics of FET (Field EffectTransistor).
7. Setting of a transistor amplifier and determination of the amplification factor at variousfrequencies

8. Frequency response of transistor amplifier with the withoutfeedback
9. Characteristics of Hartleyoscillator
10. Determination of different parameters oftransistor
11. Study of multivibrator -Astable
12. Study of multivibrator -Bistable
13. Study of multivibrator -Monostable
14. VSWR in a microwave transmissionline
15. Study of square wave response of R.C.Network
16. Modulation ofdetection
17. Lock-in-amplifier
18. Design of operational amplifiercircuit
19. Design of a field-effect transistor crystaloscillator

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Evaluate various parameters associated with semiconductor diodes (Si, Ge, Zener, LED) and transistor amplifiers.
CO2: Apply the fundamentals of logic gates and its use in implementing basic Boolean operations.
CO3: Evaluate various parameters (resistivity, mobility) of a semiconducting material.
CO4: Use of oscillator circuits in electronic instruments.
CO5: Apply OP-AMP in solving mathematical operations.

PHY-201: Classical Electrodynamics

Course Objective: *To apprise the students regarding the concepts of electrodynamics and Maxwell's equations and apply in various problem of physical sciences.*

Prerequisites:*Basic Knowledge of Laws of Electrostatics and Magnetism.*

UnitI   10hrs
Waves in matter: Electromagnetic waves at plane between dielectrics and dielectric- metal. Fresnel equations for normal and oblique incidence, Energy transport, Polarization by Reflection, Total Internal Reflection, Evanescent waves, Waves in a Multilayer.

Waveguides and resonators: TE & TM modes in dielectrc slab, Wave guide, Cylindrical wave-guides and cavity, modes of rectangular waveguides with conducting walls. Dispersion: The frequency dependence of permittivity, Dispersion in conductors and Kramers- Kronig relations

UnitII   10hrs

Potential formulation: Vector and scalars potentials, Wave equation for potentials, Gauge Transformation, Coulomb and Lorentz gauge conditions. Greens function solution of potential form of Maxwells equations, Retarded potential, retarded solutions for field, Poynting theorem in dispersive media. Lienard-Wiechert Potentials, Fields and power of an accelerated point charge, Larmours formula.

UnitIII   10hrs

Radiation: Electric dipole, Magnetic dipole, Electric Quadrupole and any arbitrary source, radiation from Linear Centre-Fed Anteena, angular distribution of power radiated, radiation from circular orbits. Classical cross section for radiation, Bremstrahlung in coulomb field, Cherenkov radiation.

UnitIV   10hrs
Scattering: Scattering by small dielectric &perfectly conducting sphere and Conducting Cylinder, Radiation damping of a charged harmonic oscillator, scattering by an individual free scattering electron (Thomson Scattering), Scattering by bound electron (Rayleigh Scattering).
Relativistic Electrodynamics: Tensor notation of relativistic fields and potentials, Maxwell's equations.

4. Classical Electricity and Magnetism - Wolfgang K. H. Panofsky and Melba Phillips, (2005), Dover Publications, 2nd Edition.

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Design of Maxwell's equation and their applications in electromagnetic potentials and
Gauge transformations.
CO2: Explain the various modes of propagation of plane electromagnetic wave in different media.
CO3: Analyze the electromagnetic fields and radiation of a localized oscillating source (antenna).
CO4: Apply the theory of scattering to various electromagnetic operations.

PHY-202: Quantum Mechanics – II

Course Objective: *To understand the basic techniques & methods for solving general problems in quantum mechanics and apply these methods in various fields of research and development.*

Prerequisites: *Operator formalism of solving one-dimensional harmonic oscillator, Eigen value and Eigen function of hydrogen atom, Addition of angular momenta (C.G. Coefficients).*

UnitI   **10hrs**

TimeIndependentPerturbationTheory: RayleighSchrodingerMethodforTime-IndependentNon-Degenerate Perturbation Theory, First and Second Order Correction, Perturbed Harmonic Oscillator, Anharmonic ooscillator, The Stark Effect, Quadratic Stark Effect and Polarizability of Hydrogen atom, Degenerate Perturbation Theory, Removal of Degeneracy, Parity, Parity of atomic states, Parity Selection Rule, Linear Stark Effect of Hydrogenatom.

UnitII   **10hrs**

Correction factors: Spin-Orbit Coupling, Relativistic Correction, Fine Structure of Hydrogen like Atom, Nor-mal and Anomalous Zeeman Effect, The Strong-Field Zeeman Effect, The Weak-Field Zeeman Effect and Lande's g-factor.

Variational Methods: Ground State, First Excited State and Second Excited State of One-Dimensional Harmonic Oscillator, Ground State of H-atom and He-atom.

UnitIII   10hrs

WKB Approximation Method: General Formalism, Validity of WKB Approximation Method, Connection Formulas,BohrSomerfieldQuantizationRule,ApplicationtoHarmonicOscillator,BoundStatesforPotential WellswithOneRigidWallandTwoRigidWalls, Tunneling ThroughaPotentialBarrier,ColdEmission,Alpha Decay and Geiger-Nuttalrelation.

Time Dependant Perturbation Theory: Transition Probability, Constant and Harmonic Perturbation, Fermi Golden Rule, Interaction of one electron atoms with electromagnetic radiation, Basic Principles of Laser and Maser. Electric Dipole Radiation and Selection rules. Spontaneous Emission Einstein's A, BCoefficients, radiation, Quantum description of spontaneous emission.

UnitIV   10hrs

Scattering: Scattering amplitude and differential cross Section, Relation between Lab and CM cross sections, Born Approximation. Application to Coulomb and Screened Coulomb Potential, Partial Wave Analysis for Elastic and Inelastic Scattering, Effective Range and Scattering Length, Optical Theorem, Black Disc-Scattering, Hard-Sphere Scattering, Resonance Scattering from a Square Well Potential, Scattering of identical particles.

4. Introductory Quantum Mechanics- R. L. Liboff, (2009), Pearson Press, 3rd Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1: Understand non-exact solutions for stationary states through time independent non-degenerate perturbation theory.
CO2: Interpret the non-exact problems pertaining to stark effect and Zeeman Effect by the knowledge of time independent degenerate perturbation theory.
CO3: Determine Eigen value of non exact solutions by applying Variational and WKB- approximation method.
CO4: Apply the concept of lasing action for LASER and MASER by time dependent perturbation theory.
CO5: Evaluate scattering cross-section for a scattering system by using partial wave analysis of elastic and inelastic scattering.

PHY-203: Solid State Physics

Course Objective: *To study some of the basic properties of the condensed phase of matter especially Crystal Structure, Electric, Dielectrc, Magnetic and thermal behaviour of solids.*

Prerequisites:*Basic knowledge on crystal structures and system.*

UnitI10hrs
Crystal Structure: Bravais lattices (crystalline periodicity and unit cells), Miller Indices, Reciprocal lattice and Brillouin zones, Crystal diffraction and the structure factor.
Crystal binding: Crystal of inert gases, ionic crystals, covalent crystals, Metallic binding, and hydrogen bounded crystals.
Phonons and lattice vibration: Vibrations of monatomic and diatomic lattices, dispersion, relation, optic and acoustic modes, Quantum of lattice vibration and phonon, phonon momentum, inelastic scattering of neutrons and photons by phonons.

UnitII   **10hrs**
Thermal Properties of insulators: Lattice heat capacity, Debye & Einstein model, Anharmonic crystal interactions, thermal conductivity and thermal expansion.
Free Electron Fermi Gas: Density of state in one dimension, effect of temperature on Fermi-Dirac distribution,Freeelectrongasinthreedimensions,Heatcapacityofelectrongas,TheBoltzmannequation,Electrical conductivity, General Transport coefficients, Thermal conductivity, Thermoelectriceffect.

UnitIII   **10hrs**
Semiconductors: Intrinsic and impurity semiconductors, band gap, law of mass action, intrinsic carrier concentration, mobility in the intrinsic region, p-n junction rectification.

Band theory: Electrons in periodic potential, Bloch's theorem, Kronig-Penney model, origin of band gap, Waveequationforanelectroninaperiodicpotential,Blochfunctions,Brillouinzones,E-K diagramunderfree electronapproximation.

UnitIV   **10hrs**
Magnetism: Brief concept on Diamagnetism and paramagnetism,Weiss theory of ferromagnetism, Curie-Weiss Law for susceptibility, Heisenberg model- Conditions for ferro- and antiferro-magnetic order, Spin waves and magnons, Bloch's T_2 Law, Antiferromagnetic order, Neel Temperature. Diluted Magnetic Semiconductors.

5. Semiconductor Physics and Devices (Basic Principles)- Donal A Neamen, (2012), Tata McGraw-Hill, 3rd Edition.

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Understand various aspects of materials related to crystallography and lattice vibrations.
CO2: Interpret phonon vibrations in various lattice and their effects in heat capacity of solid.
CO3: Analyze the behavior of semiconductor under different conditions in fundamental research.
CO4: Explain the dielectric and magnetic behaviour of novel materials and their applications.

PHY-204: Applied Optics

Course Objective: *The main objective of this course is to teach the students the advance concepts of optics like holography, nonlinear optics.*

Prerequisites: *Basic knowledge on Wave optics and Electrodynamics*

UnitI   **10hrs**

Optics of solids: Plane wave in anisotropic media, types of crystal, Double Refraction at a Boundary, Optical Activity, Faraday Rotation in Solids, Magneto-optic and Electro-optic Effects, Introduction to Nonlinear Optics.

UnitII   **10hrs**

Fourier Optics: Basics of Fourier transformation operation, Definition of spatial frequency and transmittance function, Fourier transform by diffraction and by lens, Spatial frequency filtering, types of filters, Abbe-Porter experiments, phase-contrast microscope.

Holography: Principle of holography, On-axis and off-axis hologram recording and reconstruction, Types of hologram and applications.

UnitIII   **10hrs**
Laser spectroscopy: Laser-induced breakdown spectroscopy (LIBS), Laser induced fluorescence spectroscopy, Applications of laser spectroscopy: single molecule detection, trace level detection of explosives and hazardous gases, LIDAR.

UnitIV   **10 hrs**

Nonlinear spectroscopy: Basics of nonlinear optics, nonlinear absorption, saturation spectroscopy two-photon and multi-photon spectroscopy and its applications.

3. Basics of Holography- P. Hariharan, (2002), Cambridge University Press, 1st Edition
4. Principles and Applications of Fourier Optics – R. K. Tyson, (2014), IOP Publishing, 1st Edition

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Understand basic principle of optical properties of solids.
CO2: Apply the basic concepts of Fourier and holography in various optical devices
CO3: Interpret the idea of LASER Spectroscopy for detection of trace level in hazardous gases.
CO4: Apply the multi photon microscopy for various applications.

CO4	1	1	3	2	3	3

PHY-205: Computational Physics Lab
Laboratory (6 hrs per week)

Course Objective: *To solve physics problems through different numerical techniques using computer programming.*

Introduction to computer hardware and software, introduction to storage in computer memory, stored programme concepts, storage media, computer operating system, compilers, LINUX commands;

Programming with FORTAN: Programme solving on computers - algorithm and flow charts in FORTAN data types, expressions and statements, input/output commands, sub programme,

Programming with C++: Structure of C++ programme, compilation , Data types, variable and constant, declaration of variables, initializing variables, arithmetic operators, Increment and Decrement operators, I/O statements, arithmetic expressions, functions, Control statements: decision making and looping statements, array.

Exercises for acquaintance:

1.   To find the largest or smallest of a given set ofnumbers
2. To generate and print first hundred primenumbers
3. Sum of an AP series, GP series, Sine series, Cosineseries
4. Factorial of anumber
5. Transpose a squarematrix
6. Matrix multiplication,addition
7. Trace of amatrix
8. Evaluation of log andexponentials
9. Solution of quadraticequation
10. Division of two complexnumbers
11.   To find the sum of the digits of anumber

NumericalAnalysis:

1. Interpolation by Lagrangemethod
2. Numerical solution of simple algebraic equation by Newton- Raphsonmethod
3. Numerical integration : Trapezoidal method, Simpons method, Romberg integration, Gauss quadrature method
4. Eigenvalues and eigenvectors of amatrix
5. Solution of linear homogeneousequations
6. Matrix multiplication,addition
7. Trace of amatrix
8. Matrixinversion.
9. Solution of ordinary differential equation by Runge-KuttaMethod
10. Solution of Radioactive decay, Simple harmonic oscillator, SchroedingerEquation.

COURSE OUTCOME

After completing this course, the students should be able to:

CO1: Design stable algorithms for solving numerical problems using various computer programs.
CO2: Apply numerical techniques to solve linear equations.
CO3: Apply techniques to solve systems of equations using typical matrix methods.
CO4: Compute numerical differentiation and integration using interpolation.

PHY-206: Departmental Specific Elective (DSE)
Atomic and Molecular Spectroscopy

Course Objective: *To learn various spectroscopic techniques for understanding the behaviour of materials.*

Prerequisites: *Basic knowledge on fundamentals of quantum mechanics and hydrogen atom problems.*

UnitI   10hrs

Electron spin and vector atom model, Spin Orbit interaction, Hydrogen Fine structure, Lamb Shift, L-S &J-J Coupling: spectroscopic terms,selectionrule,LandeIntervalrule,ZeemanEffect(normalandAnomalous)andPaschen-BackEffect: Splittingofspectrallinesandselectionrules,HyperfineStructureSpectralLines:IsotopeEffect,Nuclearspin andHyperfineSplittingandselectionrules.

UnitII   10hrs

Molecular Electronic States: Molecules and Chemical bonds: Molecular Formation, Ionic binding, Covalent Binding, Valence-bond treatment of H2+, The LCAO method for H2+. The Stability of Molecular States Concept of molecular potential, Separation of electronic and nuclear wave functions, Born-Oppenheimer approximation,Electronicstatesofdiatomicmolecules,Electronicangularmomenta,Approximationmethods for the calculation of electronic Wave function.

UnitIII   10hrs

RotationandVibrationofMolecules:Solutionofnuclearequation;Molecularrotation:Non-rigidrotator,Centrifugal distortion, Symmetric top molecules, Molecular vibrations: Harmonic oscillator and the anharmonic oscillator approximation, Morsepotential, Symmetries of electronic wave functions, Shapes of molecular orbital and bond, Term symbol for simplemolecules.

UnitIV   10hrs

Spectra of Diatomic Molecules: Transition matrix elements, Vibration-rotation spectra: Pure vibrational transitions,Purerotationaltransitions,Vibration-rotationtransitions,Electronictransitions: Structure,Franck-Condon principle, Rotational structure of electronic transitions, Fortrat diagram, Dissociation energy of molecules, Continuous spectra, Raman transitions and Ramanspectra.

5. Modern spectroscopy-J.M. Holias, (2004), John Wiley and Sons ltd., 4th edition.

COURSE OUTCOME

After completing this course, the students should be able to:

CO1: Analyze energy splitting and allowed transitions of atomic spectra under various conditions.

CO2: Explain the molecular formation and their stability.

CO3: Determine internuclear separation, atomic mass, moment of inertia from fundamental aspects of rotational and vibrational spectroscopy.

CO4: Demonstrate the origin of molecular electronic states and their intensities distribution.

CO5: Determine symmetry element of molecules and their allowed modes of vibrations of in rotational and vibrational spectroscopy.

PHY-301: Nuclear Physics

Course Objective: *To impart knowledge about basic nuclear physics properties, Nuclear force and nuclear models and also understanding of related reaction dynamics.*

Prerequisites: *Elementary idea of quantum mechanics and nuclear structure*

UnitI   **10hrs**

Brief Discussion of Nuclear Properties: Nuclear Radius, Nuclear Mass, and Binding Energy, Angular Momentum, Parity and Symmetry, Magnetic Dipole Moment and Electric Quadruple Moment.
Two Nucleons Bound State Problem: Central and noncentral forces, deuteron and its magnetic moment and quadrupole moment; Force dependent on isospin, exchange force, charge independence and charge symmetry of nuclear force, mirror nuclei.

UnitII   **10hrs**

Nuclear Structure: Form factor and charge distribution of the nucleus, Hofstadter form factor.
Nucleon Scattering Problem: n-p scattering at low energy, scattering cross section and scattering length, effective range theory. Nuclear force: Meson theory of nuclear force, Yukawa interaction.

UnitIII   **10hrs**

NuclearModels: Singleparticlemodelofnucleus,Liquiddropmodel,Bohr-Wheelertheoryoffission,nuclear fusion,Shellmodel,analysisofshellmodelpredictions,magicnumbers,spin-orbitcoupling,angularmoment and parities of nuclear ground states, magnetic moments and Schmidt lines, Collective model of Bohr and Mottelson.

UnitIV   **10hrs**

Nuclear Reactions and nuclear energy: Energetics of nuclear reaction, compound nucleus theory, resonance scattering, Breit-Wigner formula, Alpha decay, Fermi's theory of beta decay, Selection rules for allowed transition, parity violation.

3. Introductory Nuclear Physics- Samuel S. Wong, (1990), Prentice Hall International Inc., 1st Edition

COURSE OUTCOME
After completing this course, the students should be able to:

CO1: Understand the basic nuclear properties and nuclear stability.
CO2: Understand nuclear structure and theory associated with nuclear scattering.
CO3: Interpret the nuclear models associated with nuclear structure and stability.
CO4: Explain process nuclear reactionsassociated with alpha decay and beta decay.

PHY-302: Particle Physics

Course Objective: *To impart knowledge about the developments in the area of high energy Physics and introduce the fundamental concepts relevant to interactions and fields in particle Physics, invariance principles and conservation laws and symmetries in particle physics.*

Prerequisites: *Basic knowledge on Quantum Mechanics, Nuclear Physics, Theory of Relativity, Group Theory*

UnitI   **12hrs**

Historical introduction to the Elementary Particles, Natural Units, Relativistic Kinematics: Lorentz transformations, four vector, Energy and momentum, Collisions, Examples and application, The Standard model of particle physics, Classification of elementary particles and their interactions, fermions and bosons, lepton flavors, quark flavors, electromagnetic, weak and strong processes, Lepton number , Baryon number, color quantum number, Strangeness quantum number.

UnitII   **10hrs**

C.G.Coefficients,Two nucleon state vectors, Isospin, Strangeness and Hypercharge, Lepton and Baryon number conservation, Yukawa's theory, Neutrinos, Charge independence of nuclear forces, Isospin, Test for isospin conservation, Associated production of strange particles, Gell-Mann Nishijima scheme, conservation laws in relation to particle reaction particle reactions and decays.

UnitIII   **10hrs**

Discrete Symmetry: Parity(P): Parity in quantum mechanics Parity, Parity conservation and non-conservation, Time reversal, Consequences of time reversal invariance, Charge conjugation, G-parity, Statement of CPT theorem and its consequences, Proof of equality of mass and life time for particle and anti particle.

UnitIV   **8hrs**

Unitary symmetry: Unitary Symmetry and the classification of state, Hadrons and SU (3) multiplets, concept of I-Spin ,U-spin ,V-Spin, Su(3) quark model, the Eight fold way, Mesons and Baryons in the octet representation , the baryon Decouplets, Evidence of color, Prediction of SU(3), Gell-Mann-Okubo mass formula, meson mixing.

2. Modern elementary particle physics-G.Kane(2017), Cambridge University, 2nd Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1: Understand the quantum mechanical properties of elementary particles based on

strong and weak interactions.

CO2: Explain various parameters associated with elementary particles.
CO3: Interpret the properties of elementary particles with respect to symmetry.

CO4: Explain relativistic kinematics and Unitary symmetry associated with elementary particles.

PHY-303: Special paper- I
Advanced Condensed Matter Physics

Course Objective: *The main objective is the erudition on lattice vibration, energy band, Fermi Surface, electron approximation and electron interaction and also to have a proper idea on Lattice Defects, Excitons and Hall effect.*

Prerequisites: *Basic knowledge on basic condensed matter Physics and Quantum Mechanics.*

UnitI   12hrs

Lattice Vibrations: Born-Oppenheimer Approximation, Hamiltonian for lattice vibrations in the harmonic approximation, Normal modes of the system and quantization of lattice vibrations-phonons. Electron-phonon interaction, Second quantized form of Hamiltonian for electrons and phonons in interaction.

Energy Bands: Nearly free electron approximation - Diffraction of electrons by lattice planes and opening of gap in E-K diagram. Effective mass of electrons in crystals, Holes, Tight binding approximation, S and P stateband, Warnier functions, Equation of motion in the Wannier representation, The equivalent Hamiltonian Impurity levels, Density of states

UnitII   10hrs

Fermi Surface: Characteristics of fermi surfaces, construction of the Fermi surfaces, case of metals, experimental studies of the fermi surfaces, De Hass Van Alphen effect, Cyclotron resonances in metals.

Beyond the Independent Electron Approximation: Hartree and Hartree-Fock equation, correlation, Screening, Thomas Fermi Theory of dielectric function.

UnitIII   08hrs

Electron Interaction: Perturbation formulation, Dielectric function of an interacting electron gas (Lindhard's expression), Static screening, Screened impurity, Kohn effect, Friedel Oscillations and sum rule, Dielectric constant of semiconductor, Plasma oscillations

UnitIV   10hrs

Electronic and Lattice defects: Lattice defects, Frenkel and Schottky defects. Line Defects, edge and screwdislocations-Burger's Vector, planner (stacking) faults-twinplanes and grainboundaries Colorcenters-mechanism of coloration of a solid, F-center, Other colorcenters.

Excitons: Loosely bound, tightly bound, Excitonic waves, electron-hole droplets.

Hall effect: Elementary ideas on Quantum Hall Effect, Magnetoresistance, Elementary ideas on Giant magneto-resistance and Colossal magneto resistance.

6. Introduction to Solids - L.V. Azaroff (1993), Mc-Graw Hill Publisher, 1st Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1: Understand the concept of lattice vibration and energy bands in solid states.
CO2: Interpret the characteristics of Fermi surfaces for electron approximation theory.
CO3: Analyze the dielectric constant of semiconductor through electron interaction theory.
CO4: Compare various types of electronic and lattice defects.
CO5: Apply magneto-resistance property for various sensing applications.

PHY-304: Statistical Mechanics

Course Objective: *To apply the theory of statistical mechanics for understanding thermodynamic parameters for micro and macro systems.*
Prerequisites: *Basic concepts of theory of Thermodynamics and Probabilistic approach of Quantum Mechanics.*

UnitI   10hrs
Classical statistical Mechanics : Postulates of classical statistical mechanics , Liouville's theorem micro-canonicalensemble,derivationofthermodynamics,equipartitiontheorem, Classicalidealgas, Gibb'sparadox, canonical and grand canonical ensemble theory, classical systems, density fluctuation in grand canonical ensemble, harmonic oscillator, application to magnetic system.

UnitII   10hrs
Quantum Statistical Mechanics: Postulates of quantum statistical mechanics, density matrix, Liouville's theorem, ensembles in quantum statistical mechanics, third law of thermodynamics, ideal gases in micro - canonical and grand canonical ensemble, particle in a box, linear harmonic oscillator, Maxwell-Boltzmann, Boltzmann-Einstein and Fermi-Dirac distributions.

UnitIII   10hrs
Bose and Fermi gas: Photons, phonons, Debye-specific heat, electronic specific heat, Bose-Einstein Condensation, Fermi energy, Ground state, Low temperature properties, Mean energy of fermions at absolute zero, Magnetic behavior of an ideal Fermi gas, Theory of White – Dwarfs (without derivation).

UnitIV   10hrs
Phase Transition and Ising model: Thermodynamics description of Phase Transitions, Phase Transitions of second kind, Landau theory of phase transition beyond mean field, Definition of the Ising model, one dimensional Ising model.

3. Fundamental of statistical mechanics- B. B. Laud, (2012), New age international Pvt. Ltd,2nd Edition.
4. Statistical Mechanics- R.K. Pathria, Paul D. Beale, Elsevier Science, 4th Edition.

Reference Books:
1. Statistical Physics- Landau and Lifsitz, (2013), Pergamon Press, 3rd Edition, 2013
2. Elementary Statistical Physics, C.Kittel, (2008),John Wiley & Sons, 2nd Edition.
3. Statistical Mechanics - A set of lectures, R.P.Feynman, (2008), The Benjamin publishing company, Inc.
4. Introduction to Statistical Physics- Kerson Huang, (2002), Taylor & Francis, 2nd Edition.

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Understand the concept of statistical physics and thermodynamics as logical consequences of the
       postulates of statistical mechanics.
CO2: Interpret the concept of types of ensembles and calculation of general probability statements for variety of
        situation of physical interest.
CO3: Analyze the problems involving gases at low temperature or high densities and problems encountered in
        connection with the indistinguishable particles.
CO4: Apply Fermi-Dirac and Bose-Einstein statistics to different physical systems.
CO5: Apply different model for phase transitions through statistical techniques to simulate the structure of a physical
substance.

CO-PO Mapping (PHY 304)

PHY-305: Optics and Modern Physics
Laboratory (6 hrs per week)

Course Objective: *To demonstrate various experiments to understand the critical aspects of wave optics like polarization, diffraction and phenomena in modern Physics.*

Optics:
1. Experiments with optical bench Biprism Straight edge and narrowwire.
2. Experiments with spectrometer: Single and Doublesplit.
3. Experiments with Michelson interferometer : Determination of λ and a Thickness of micasheet
4. Fabry Perotinterferometer
5. PolarizationExperiments
   - Babinetcompensator
   - Edsar-Butlerbands
   - Quarter waveplate
   - MallusLaw
   - Study of elliptical polarizedlight
6. Babinet QuartzSpectrography

Modern Physics:
1. e/m measurement by ThomsonMethod

2. Magnetic field measurement by searchcoil
3. Ferroelectric transmission point by Dielectric ConstantMeasurement
4. Dielectric constant of solid (wax) by LecherWire
5. Verification of Richardson's T^2 law
6. Determination of Planck's constant by total RadiationMethod
7. Determination of Planck's constant by Reverse Photoelectric effectmethod
8. Hysteresis looptracer
9. Determination of "e" by Millikan's oil dropexperiment
10. Measurement of attenuation and phase shift of A.C. in L.C.R. network
11. RF characteristics ofcoil
12. Calibration of anoscilloscope
13. Stefan's constantmeasurement
14. Existence of discrete energy level by Frank Hertzexperiment.
15. GMcounterexperiments:CharacteristicsoftheGeigertube,InverseSquareLaw,Absorptioncoefficient of the aluminiumfoil.
16. Resistivity and Band gap measurement by four probe method.
17. Constant DeviationSpectrograph
    - Calibration
    - Zeemaneffect

COURSE OUTCOME
After completing this course, the students should be able to:
   CO1: Understand the fundamental concepts of interference, diffraction and polarization of light.
   CO2: Apply the basic knowledge of Modern Physics to determine resistivity, Band gap and Hall coefficient of a semiconductor.
   CO3: Determine the key electric and magnetic properties of materials.

PHY-306: Inter-disciplinary ElectiveCourse
(Nano-Science and Nanotechnology)

Course Objective: *The main objective of the course is to help the students understand in broad outline of Nanoscience and Nanotechnology.*

Prerequisites: *Basic knowledge on Quantum Mechanics, Properties of matter.*

UnitI   10hrs

Background to Nanoscience and nanotechnology: Definition of Nano, Scientific revolution-Atomic Structure and atomic size, emergence and challenges of nanoscience and nanotechnology, large surface to volume ratio for nano materials, influence of nano over micro/macro, size effects and crystals.

UnitII   10hrs

Moore's law, Classification of nanomaterials: 0D, 1D, 2D, 3D; Characteristic feature of nanomaterials, Density of states for various classes of nano materials, quantum confinement effect on nanomaterials, 2D- Quantum well, 1D-Quantum wire, OD-Quantum dot,Surface and physical properties of nanomaterials.

UnitIII   10hrs

Nanomaterials fabrication: Different approach of synthesis, Bottom-up approach (Coprecipitation, Sol-Gel Process, Hydrothermal/Solvothermal Methods, Thin-Film Deposition Mechanism, Physical Vapor Deposition (PVD), Chemical Vapor Deposition (CVD)), Top-Down approach(Powder metallurgy, Lithography), characterization of nano materials.

UnitIV   10hrs

Basic features of CNT and Graphene, Application of Nanomaterial: Ferroelectric materials, coating, molecular electronics and nanoelectronics, biological and environmental, Nanocomposites.

4. Essentials in Nanoscience and Nanotechnology – N. Kumar and S. Kumbhat (2016), Wiley, 1st Edition.

COURSE OUTCOME

After completing this course, the students should be able to:
CO1: Explain the properties of nanomaterials
CO2: Classify nanomaterials with respect to their different dimensions.
CO3: Apply various methods forsynthesis of nanomaterials.
CO4: Apply nanomaterials in various applications.

PHY-401:Energy Harvesting and Storage Materials

Course Objective:*The main objective of this course is to introduce the students about various materials and devices for energy harvesting and storage.*

Prerequisites:*Basic knowledge on semiconductors, thermodynamics, Electro-chemical properties of materials.*

UnitI   10hrs
Theory of p-n junction, concept of depletion later, resistance and capacitance across the depletion layer Charge transport in a p-n junction; Practical junctions and Ideality factor; Space charge and diffusion capacitances. Surface states and related band bending Equilibrium and non-equilibrium processes, Charge transport equation Metal-semiconductor junctions, Ohmic and Schottky contacts, Schottky barrier and barrier lowering effects.

UnitII   10hrs
Solar Cell: Solar cell and its system components, different solar cell and fabrication methods, calculating output and dimensioning of solar cell systems, solar cells in concentrated sunlight, Efficiency of solar cell, series connection of solar cells to modules: functions and characteristics.

UnitIII   10hrs
Fuel Cell: Fuel cell definition, components, principle of working, thermodynamics and efficiency of fuel cells, Butler-Volmer equation, types of fuel cells and its chemistries – AFC, PAFC, PEMFC,MCFC, DMFC and SOFC – merits and demerits, Hydrogen – production and storage methods for fuel cells, Application of SOFC.

Batteries and Super Capacitors: Batteries: Primary, Secondary batteries, Basic concepts of primary and secondary batteriesadvantages and disadvantages. Super capacitor: Electrochemical Double Layer Capacitor (EDLC), principle of working, role of activated carbon and carbon nano-tube (CNT).

5. Fuel Cell Technology: Hand Book- G. Hoogers (2003) CRC Press, 1st Edition.
6. Introduction to Nano (Basics to Nanoscience and Nanotechnology) – A. Sengupto and C. K. Sarkar, (2015), Springer, 1st Edition.
7. Active Plasmonics and Tuneable Plasmonic Metamaterials- Anatoly V. Zayats, Stefan Maier, (2013), Wiley, 1st Edition.

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Understand the theory of semiconducting materials in various energy harvesting devices.
CO2: Understand the principle and efficacy of solar cell.
CO3: Apply fuel cell for hydrogen production and storage.

CO4: Use batteries and super capacitors for different energy storage applications.

PHY-402: Advanced Quantum Mechanics

Course Objective: *To apply theory of relativistic quantum mechanics and field theory to understand critical aspects of high energy physics and advanced condensed matter physics.*

Prerequisites: *Basic knowledge on fundamentals of non-relativistic quantum mechanics, theory of relativity, Formulism on four vector representations.*

UnitI   **08hrs**

Klein-Gordon Equation: Need for a relativistic equation, Klein-Gordon equation and its drawbacks, Real and Complex Klein-Gordon fields, Klein-Gordon equation with electromagnetic field.

UnitII   **12hrs**

Dirac Equation: Dirac equation, Magnetic moment of electron, Spin-Orbit coupling, Darwins term, Non-relativistic reduction of Dirac equation, Properties of Dirac gamma-matrices, Free particle and plane wave solution of Dirac equation with physical interpretation, Normalized Dirac spinors.

UnitIII   **12hrs**

Covariance of Dirac equation and Hole Theory: Lorentz transformation,Covariance of Dirac equation and bilinear covariant, Projection operator for Energy and spin, Zitterbewegung, Dirac Hole theory.

UnitIV   **08hrs**

SymmetryinDiracequation: Chargeconjugation, space reflection, timereversalsymmetriesofDiracequation, Continuous systems and fields, Real (Classical) and Dirac fields, Lagrange and Hamiltonian formulation, Noether'stheorem, Second Quantization, Gordon decomposition, Normal ordering.

3. Quantum Field Theory- L. H. Ryder (2017) Cambridge University Press, 2nd Edition

4. Advanced Quantum Mechanics- F. Schwabl (2005), Springer, 3rd Edition

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Understand the concept of Klein-Gordon equation and its drawbacks.
CO2: Interpret the properties of Four vector Dirac gamma matrices as obtained from Dirac equation
       and its positive and negative energy states.
CO3: Interpret the properties of a Dirac particle through its covariant Lorentz transformation.
CO4: Analyze the various quantum fields associated with a Dirac particle and its charge conjugate as well as
       time reversal states.

PHY-403: Special paper II
Advanced Condensed Matter Physics

Course Objective: *To study the concepts of condensed matter physics such as Lattice vibration, band gap calculation and then sequentially explore the interaction effects of electron-electron/phonon, and finally the superconductivity with its microscopic concept.*

Prerequisites: *Basic knowledge on basic condensed matter Physics and Quantum Mechanics.*

UnitI   10hrs

Quantization of lattice vibration: Phonons normal coordinate transformation creation and annihilation operators methods of band calculation-tight binding method, OPW and pseudo-potential methods For surface de Haas Van Alphen effect Transport theory Boltzmann equation, relaxation Time approximation electrical conductivity and thermal conductivity.

UnitII   10hrs

Electron - electron interaction: Introduction, Hartree - Fock approximation, Hartree - Fock theory for helium Density functional theory general formulation. Local Density approximation

UnitIII   10hrs

Superconductivity: Experimental survey, Meissner effect, Type-I &Type-II superconductors, thermodynamic properties of superconductors, London's theory, Isotopic effect, Flux quantization, BCS Theory

UnitIV   10hrs

Advanced Superconductivity: Electron-electron attractive interaction due to virtual phonon exchange, Cooper pairs and BCS Hamiltonian. Superconducting ground state and the gap equation at T = 0 K.Josephson effect: Macroscopic quantum mechanical effect, DC ,AC Josephson effect, Effect of magnetic field.High- Tc superconductors: Basic ideas and applications.

3. Introduction to solid state physics- C. Kittel(2016), John Wiley & Sons, 8th Edition.

COURSE OUTCOME
After completing this course, the students should be able to:
CO1: Explain the quantization process associated with lattice vibration.

CO2: Understand various electron-electron interaction theory.
CO3: Interpret the theory of superconductivity for various types of superconductors.
CO4: Analyze the quantum mechanical aspect associated with superconducting materials.

PHY-404:Experimental Techniques in Physics

Course Objective: *To train the students about various methods of growth and Characterizations of materials; understanding the behaviour of elementary particles and phenomena inmodern Physics.*

Prerequisites: *Basic knowledge on Materials properties, Quantum Mechanics and Nuclear Physics*

UnitI   **10hrs**
Synthesis of Materials: Top-Down and Bottom-up approach, Physical vapor deposition (PVD),Chemical vapour deposition (CVD), Sol-Gel, Electro deposition, Spray pyrolysis, Hydrothermal synthesis. Spin-coating, plasma sputtering, Auto-Combustion, General idea of Lithography.

UnitII   **10hrs**
Structural and Optical characterization: structural analysis by X-Ray diffraction, band gap measurement by UV-Vis spectroscopy, Raman spectroscopy,Fourier transform infrared spectrometer (FTIR).

UnitIII   **10hrs**
Microscopic properties: Scanning Electron Microscopy, Transmission Electron Microscopy (basic idea only), atomic force microscopy, **Thermal Properties:** DSC/DTA and TGA, **Mechanical properties:** operation of universal testing machine.

UnitIV   **10hrs**
Geiger-Mueller counter: Operating plateau and resolving time for the GM tube, Half-life measurement, linear absorption coefficient, The inverse square law, Statistical variation of data, Gamma-Ray spectroscopy using NaI(Tl): Gamma energy calibration, Identification of unknown gamma emitters, Electron spin resonance:

magnetic field as a function of resonance frequency, Lande's g-factor for electron, the differential cross section for Compton scattering.

PHY-405: Project/Dissertation

Course Objective: *Create new physical device or models by applying the basic knowledge of Physics.*

Dissertation is allotted to the P. G. students. For each student a faculty member is assigned as Guide by the Head of the Department. A title or objective of the Dissertation must be chosen by the student in consultation with the Guide. Guide is required to assess the advancement by the student in the Dissertation work.

Course outcome

CO1: Apply the knowledge of Physics for predicting various physical phenomena.
CO2: Design tailor made materials for device applications.
